a modified polylinker; Site 1: Not 1; Site 2: Eco RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NbHLI9W, testis NH7, and B-cell
NCI CGAP_GCB1) were mixed, and ss circles were made in
vitro. Following HAR purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of

/note="Organ: pooled; Vector: pT773D-Pac (Pharmacia) with a modified polylinker; Site 1: Not I; Site 2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbH119W, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239,

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacis), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT713 vector. Library went through one round of normalization to Cot5, and was constructed by Bento Soares and M. Fatima Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         te53g03.x1 Soares NPL T GBC S1 Homo sapiens cDNA clone INAGE:2090452 3', mRNĀ Bequence.

/note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not 1; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL)9W, testis NHT, and B-cell NCI CGAP GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. "

Full length GENSET human nucleic acids encoding potentially secreted proteins, useful in gene therapy and vaccination against a variety of diseases, and for diagnosis of those diseases.

Claim 21; Page 804; 921pp; English.

The invention relates to full length GENSET human nucleic acids encoding potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's gene expression by rectifying mutations or deletions in a patient's patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their

probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy. The GENNET polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of GENSET polypeptide expression and activity. The present sequence is a GENSET polypeptide the invention
                                                                                                                                                                                                                                                                                                                        61 RIHTYVYEFIYLVRDCGIRTRVVSEETLLFQTELYFTPRNIDHDPQEIHLECSTSRKSVW 120

The invention relates to an isolated polypepties comprising valued to acid sequence at least 90% identical to CGDD, a biologically active acid sequence at least 90% identical to CGDD, a biologically active acid sequence at least 90% identical to CGDD, a biologically active acid sequence at least 90% identical to CGDD, a biologically active fragment or an immunopeance fragment. Also included are the comprising a promoter sequence operably linked to the CGDD comprising a promoter sequence operably linked to the CGDD computedetides, a cell transformed with the recombinant polymucleotide, an anti-cCGD antibody, screening for compounds which bind to/modulate or are antigaonists of CGDD or alter the expression of CGDD polymucleotide and a cCGDD polymucleotide microarray. The polypeptides, polymucleotide and a cCGDD polymucleotide microarray. The polypeptides, polymucleotide and a cCGDD polymucleotide microarray. The polypeptides, polymucleotides or alternating disorders associated with aberrant expression of CGDD, polymucleotide microarray. The polypeptides, polymucleotides, cirrhosis, hepatitis, paroxysmal nocturnal haemoglobinuria, polycytheemia cirrhosis, hepatitis, paroxysmal nocturnal haemoglobinuria, polycytheemia cirrhosis, hepatitis, paroxysmal nocturnal haemoglobinuria, polycytheemia cirrhosis, psoriasis, primary thromobocytopaemia or cancer), developmental cirrhosis, hepatitis, primary thromobocytopaemia or cancer), developmental cycle, or autoinmune/inflammatory disorders (e.g. Alzheimer disease, Parkinson's disease or the mensitual cycle, or autoinmune/inflammatory disorders (e.g. Alzheimer disease, diabetes mellitus, cottact dermatitis, or utral, bacterial, fungal, parasitic, protozoal or helminthic cirrhosis, they are also useful in the assessment of the effects of exogences compounds on the expression of mucleic acid and amino acid cycle or expression of mucleic acid and amino acid cycle or expression of mucleic acid and amino acid cycle or expression of mucleic acid and amino acid cycle or expression 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RIHTYVYEFIYLVRDCGIRTRVVSEETLLFQTELYFTPRNIDHDPQEIHLECSTSRKSVW 120

```
The present invention relates to the isolation of human GSSP3

Dolypeptide, and polymucleotide sequences that encode it. The GSSP3

Dolypeptide reduces circulating blood glucose levels, increases insulin

sensitivity, and/or reduces body mass. The GSSP3 polypeptide and

Compositions comprising dSSP3 polypeptides and prevention of body weight gain.

Compositions comprising GSSP3 polypeptides are useful for controlling

Compositions comprising GSSP3 polypeptides are useful for controlling

Compositions comprising dSSP3 polypeptides are useful for controlling

Compositions comprising dSSP3 polypeptides are useful for controlling

Compositions comprising dSSP3 polypeptides are useful for controlling

Compositions at the reactions metabolic-related diseases or

disorders (e.g. obesity, impaired glucose tolerance, insulin resistance, hyperlipidaemias, atherosclerosis, heart disease, hypertension, stroke, syndrome C, type I or II diabbetes related complications,

Compositions in gricans, incroangiopathic lesions, or syndromes such as acanthosis ingricans, incroangiopathic lesions, or syndromes such as acanthosis ingricans, leprechaunism and lipoatrophy). The polypeptides

Composition in improve physical performance during work or exercise, and to treat dyslexia, attention-deficit disorder, attention-deficit disorder, attention-deficit disorders such as schizophrenia. The present sequence represents human GSSP3 polypeptide
lipoatrophy; physical performance; exercise; dyslexia; schizophrenia; attention-deficit disorder; hyperactivity disorder; psychiatric disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Reducing circulating glucose levels or increasing insulin sensitivity, useful for reducing body mass or preventing body weight gain, comprises administering composition comprising GSSP3 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yen-Potin F;

ARRABIAS) and their coding sequences (ACC50856). The proteins and their coding sequences are useful for the preparation of a diagnostic cor pharmaceutical composition for diagnosing or treating a cardiovascular disorder (e.g., arrhythmia, tachycardia, cardiac arrest, coronary arteriosclerosis and myocardial ischaemia), neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune gastrointestinal disorders, pulmonary disorders, renal disorders, for proliferative disorders and/or cancerous diseases and conditions, for coventing neural damage which occurs in neuronal disorders or infection, for treating thrombosis and arteriosclerosis, for treating or preventing neural damage which occurs in neuronal disorders or neurodegenerative conditions such as Alzheimer's disease and Parkinson's disease, to enhance bone and periodontal regeneration and aid in tissue transplants or bone grafts, to prevent skin aging or hair loss, to stimulate growth and differentiation of haemacopoietic cells and bone marrow cells when used in combination with other cytokines, to maintain organs before transplantation or for supporting cell culture of primary tissues, to increase or decrease differentiation or proliferation of embryonic stem cells, or to modulate mammalian characteristics or metabolism.                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                      ABZ71190-ABZ71478 represent cDNAs corresponding to 178 human secreted protein genes, and ABP00011-ABP00299 represent the proteins they encode. ABZ71479-ABZ714740 represent human secreted protein genomic fragments. The invention also encompasses antibodies specific for the secreted proteins, and recombinant vectors and host cells comprising a nucleic acid of the invention. The secreted proteins, nucleic acids encoding them, antibodies or antibody fragments specific for the secreted proteins, and modulators of protein activity are useful for diagnosing, treating, ameliorating or preventing digestive disorders. Such conditions include disorders of the mouth, cesophagus, stomach, small intestine, large intestine, liver, biliary treat and pancreas, and include cancers of these organs and tissues. The secreted proteins and their nucleic acids may also be used in the treatment of immune disorders, and to promote wound healing. Nucleic acids of the invention may be used for chromosome identification, chromosome mapping, in gene therapy, for identifying individuals from minute biological samples, as hybridisation probes, and as molecular weight in arkers. The present sequence represents a human secreted protein of the
                                                                                                                                                                                                                                                                                                                                                          Human, secreted protein, digestive disorder, gastrointestinal disorder, mouth, oesophagus, stomach, small intestine; large intestine; liver; blilary tract; pancreas, cancer; tumour; hyperproliferative disorder; immune disorder; inflammation; infection; wound healing; drug screening; chromogome identification; chromosome mapping; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New human secreted proteins and nucleic acids, useful for detecting, preventing, diagnosing, prognosticating, treating and/or ameliorating e.g. gastrointestinal diseases and disorders, or cancers.
                                                                                                                                                                                                                                                                                                                  Human gene 165 encoded secreted protein HTELS08, SEQ ID NO:464.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antiinflammatory; immunosuppressive; vulnerary; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       98.7%; Score 789; DB 6; Length 158; 100.0%; Pred. The invention relates to isolated nucleic acid molecules ADB91065-ADB91448 and ADB91835-ADB91911 encoding human secreted proteins ADB91449-ADB91448 and ADB91835-ADB91911 encoding human secreted proteins ADB91449-DB91844. Also disclosed is a recombinant vector comprising a polymucleotide of the invention, and a recombinant host cell comprising the recombinant vector. The polypeptide of the invention is useful in the recombinant vector. The polypeptide of the invention is useful in clentifying a binding partner by contacting the polypeptide, with a binding partner, and determining whether the binding partner increases or decreases activity of the polypeptide. The polypeptide, polymucleotide, antibody or its fragment, agonist or antagonist are useful for preparing conditions related to diabetes. The present sequence is that of the human immunoglobulin Fc portion used to generate fusion proteins, increasing conditions related protein as compared to the secreted protein conly. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 98.7%; Score 789; DB 7; Length 158; 100.0%; Pred. The polypetide, nucleic acid molecule, antibody, agonist or antagonist of the invention may be useful for preparing a composition for diagnosing or treating a haemopoietic or haematologic disorder such as anaemia, autoimmune disorders such as rheumatologic disorder such as naemia, autoimmune disorders such as rheumatologic arthritis, inflammation, Grave's disease, alsorders including Parkinson's disease, adiabetes, systemmic lupus erythematosus or glomerulomephritis, neurodegenerative disorders including Parkinson's disease and Alzheimer' disease, wounds and hyperproliferative disorders including atherosclerosis or cancer, as well as bacterial, viral, fungal or parasitic infections. The polypeptide may also be used during gene therapy procedures and for identifying a binding partner by contacting the polypeptide with a binding partner and determining whether the

The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the acids, proteins, arthritis; (b) hyperproliferative disorders e.g. rheumatoid arthritis; (b) hyperproliferative disorders e.g. neoplasms of the breast or liver; (c) cardiovascular disorders e.g. cardiac arrest; (d) cerebrovascular disorders e.g. angiogenesis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecules encoding 62 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives.
binding partner increases or decreases the activity of the polypeptide.
The current sequence is that of the human secreted protein of the

(f) nervous system disorders e.g. Alzheimer's disease, (g) infections caused by bacteria, viruses and fungi; and (h) ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis
                                                                                                                                                                                                                                                                           Otsuki T, Wakamatsu A, Sato H, Ishii S;

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or

Claim 1; Page; 222pp; English.

```
peptide of the polynucleotide by contacting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide. The oligonucleotide of the detecting the polynucleotide sud encoded proteins are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and many disease-related genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, signal transduction-related proteins, transcription-related proteins, disease-related proteins are encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The CDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the sequence data for this patent is not represented in the printed or sequence information supplied by the

The present invention relates to novel GENSET polynucleotides (ABZ154404-ABZ3641) encoding polypeptides (ABP75963-ABP76368). The polynucleotides and polypeptides are useful in screening and diagnostic assays for abnormal GENSET expression and/or biological activity. They are also useful for screening of compounds for treating or preventing GENSET-related disorders, such as heavy metal toxicity, cancer, inflammatory diseases, immune disorders, and the neuromuscular, central nervous system (CNS), cardiovascular or gastrointestinal effects of the toxicity
                                                                                                                                                                                                                                    ö

```

The present invention relates to novel GENSET polynucleotides (AB236404-AB236911) encoding polypeptides (ABP75963-ABP76368). The polynucleotides and polypeptides are useful in screening and diagnostic assays for

ö
abnormal GENSET expression and/or biological activity. They are also useful for screening of compounds for treating or preventing GENSET-related disorders, such as heavy metal toxicity, cancer, inflammatory diseases, immune disorders, and the neuromuscular, central nervous system (CNS), cardiovascular or gastrointestinal effects of the toxicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GBNSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET or by supplementing the nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be used as DNA
                                                                                                                                                                                                                                                                              RIHTYVYBFIYLVRDCGIRTRVVSEETLLFQTBLYFTPRNIDHDPQEIHLECSTSRKSVW 120

probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy. The GENSET polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of GENSET polypeptide expression and activity. The present sequence is a GENSET polypeptide of

The invention relates to a novel isolated NOVX polypeptide. The polypeptide of the invention demonstrates, antidiabetic, anorectic, acardiant, hyporensive, antiarteriosclerotic, virucide, antibacterial, tungicide, protozoacide, nocorropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiarthritic, antiinflammatory, anticonvulsant, osteopathic, antiarthritic, antiinflammatory, continued anticonvulsant, osteopathic, and antilipaemic activities. The polypeptides, nucleic acid molecules and antibodics may be useful for treating or diagnosing diseases including metabolic disorders such as diabetes and obesity, infectious diseases, anorexia, cancer, cardiovascular diseases including hypertension and atherosclerosis, neurodegenerative disorders cuch as Alzheimer's disease, Parkinson's disease and epilepsy, immune disorders e.g. osteoarthritis, haemopoietic disorders, inflammatory skin disorders, asthma and dyslipidaemia.

Churthermore, the nucleic acids and polypeptides may also be used to identify molecules that modulate or inhibit neurogenesis, cell differentiation and proliferation, haemopoiesis, wound healing and angiogenesis, as well as in gene therapy. Finally, the nucleic acids may be used as hybridisation probes, in chromosome mapping, that of preventive medicine and pharmacogenomics. The current sequence is that of

The invention relates to human NOVX polypeptides and the polynucleotides are useful for encoding them. The NOVX polypeptides and polynucleotides are useful for determining the presence of or predisposition to a disease associated with altered levels of the sequences in a mammalian subject, and for treating or preventing a pathology associated with NOVX. The polypeptides, polynucleotides and antibodies that bind immunospecifically to the polypeptides are useful for treating or preventing disorders or syndromes such as congenital heart defects, cardiomyopathy, atherosclerosis, hypertension, pulmonary stenosis, scleroderma, adenocarcinoma, haemophilia, graft-versus-host disease, cancer, neurodegenerative disorders, Alzhaimer's disease, parkinson's disease, multiple sclerosis, diabetes, obesity, bronchial asthma, acquired immunodeficiency syndrome (AIDS), Crohn's disease, infectious disease, anorexia and immune disorders. This sequence represents a human NOVX polypeptide of the invention. Note: The sequence data for this patent is also available from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        65 YVYEFIYLVRDCGIRTRVVSEETLLFQTELYFTPRNIDHDPQE--IHLECSTSRKSVWLT 122

This sequence represents a human secreted protein of the invention. The DNA encoding this sequence was isolated from a human adult placenta CDNA library, and was designated clone ej2654. The DNAs and proteins are predicted to have biological activities which would make them suitable for treating, preventing activities which would make them suitable animals, although no supporting data is given. Suggested activities include nutritional sources or supplements, immune stimulating or suppressing activity, heematopoiseis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, haematory cadherin/tumour invasion suppressor activity, and tumour activity. The DNAs are also stated to be useful for gene therapy. A host cell transfected with the DNA, or its subfragments are also stated to be useful for activity and the DNA, or its subfragments 7 New polynucleotides encoding secreted human proteins - derived from human foetal brain, adult brain, foetal kidney, adult ovary, adult retina, adult placenta or adult uterus cDNA libraries. Gaps 5, 28.0%; Score 223.5; DB 2; Length 212; 33.3%; Pred. No. 1e-16; 1ive 32; Mismatches 43; Indels 5 Query Match 28.0 Best Local Similarity 33.3 Matches 40; Conservative

Sequence 7887, Application US/09328352

Patent No. 5562987

GENERAL INFORMATION:

APPLICANT: Gary L. Breton et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER TITLE OF INVENTION: BAUMANII FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: GTC99-03PA

CURRENT APPLICATION NUMBER: US/09/328,352

CURRENT FILING DATE: 1999-06-04

NUMBER OF SEQ ID NOS: 8252

SEQ ID NO 7887
                                                                                                                                                                                                                                                               TITLE OF INVENTION:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

Sequence 260, Application US/09731872

Sequence 260, Application US/09731872

Patent No. US20020102604A1

SERERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, Jean Baptiste
APPLICANT: Dumas Milne Edwards, Jean Baptiste

APPLICANT: Dumas Milne Edwards, Jean Baptiste

APPLICANT: Jobert, Severin

TITLE OF INVENTION: FULL-LENGTH HUMAN CDNAS ENCODING POTENTIALLY SECRETED PROTEINS
FILE REFERENCE: 78.US3.REG

CURRENT APPLICATION NUMBER: US/09/731,872

CURRENT FILING DATE: 2000-12-07

PRIOR APPLICATION NUMBER: US 60/169,629

PRIOR APPLICATION NUMBER: US 60/187,470

PRIOR PILNG DATE: 2000-03-06

NUMBER OF SEQ ID NOS: 482

SOFTWARE PATENT.

LENGTH: 158
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 RIHTYVYEFIYLVRDCGIRTRVVSEETLLFQTELYFTPRNIDHDPQEIHLECSTSRKSVW 120

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Dev. Biol. 142:414-421(1990).

The pellucida glycoprotein binding, induction of the acrosome reaction and prevents post-fertilization polyspermy, is composed of three to four glycoproteins, ZP1, ZP2, ZP3, and ZP4. ZP3 is essential for sperm binding and zona marrix formation.

The SUBGINIT: Polymers of ZP2 and ZP3 organized into long filaments cross-linked by ZP1 homodimers (By similarity).

The SUBGINIT: Polymers of ZP2 and ZP3 organized into long filaments cross-linked by ZP1 homodimers (By similarity).

The SUBGINIT: Polymers of ZP2 and ZP3 organized into long filaments cross-linked by ZP1 homodimers (By similarity).

The SUBGINIT: Occapies.

The SUBGINIT: Polymers of ZP2 and ZP3 organized into long filaments cross-linked by ZP3 occapies.

The DWARN The ZP domain is involved in the polymerization of the ZP3 proteins to form the zona pellucida.

The PPM: Proteolytically cleaved before the transmembrane segment to promain and processing in the condition of the ZP3 proteins to form the zona pellucida.

The PPM: Proteolytically cleaved before the transmembrane segment to promain and processing the secreted ectodomain incorporated in the zona pellucida.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ohara O.;
Submitted (AUG-2003) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: F-actin-binding protein which may play a role in cross-linking actin to other cytoskeletal proteins. Also binds to microtubules (By similarity).
-!- SUBCELLUIAR LOCATION: Cytoplasmic.
-!- ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             O., Nagase T.;

Note=No experimental confirmation available;
-! TISSUE SPECIFICITY: Ubliquitously expressed.
-!- SIMILARITY: Belongs to the plakin or cytolinker family.
-!- SIMILARITY: Contains 1 actin-binding domain.
-!- SIMILARITY: Contains 2 CH (calponin-homology) domains.
-!- SIMILARITY: Contains 1 SH3 domain.
-!- SIMILARITY: Contains 1 SH3 domain.
-!- SIMILARITY: Contains 37 spectrin repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EWBL; AF029290; BAA83821.1; -; mRNA.
